Editorial Review

From the Back Cover

Authored by one of the world's leading organic chemists and protein engineers, this authoritative monograph provides an overview of basic strategies in directed evolution of enzymes as selective catalysts in organic chemistry and biotechnology. In introductory chapters, Manfred T. Reetz describes the most important gene mutagenesis methods and high-throughput screening and selection techniques, and continues with in-depth analyses of different strategies in laboratory evolution that have emerged in recent years. Throughout the text, emphasis is placed on methodology development in the quest to maximize efficiency, reliability and speed of directed evolution as a prolific source of robust biocatalysts for asymmetric transformations. Practical guidelines and tips regarding possible pitfalls are provided. The author critically reviews recent developments and case studies, takes a look at future applications in organic synthesis and industrial biotechnology, and concludes with a discussion of the lessons learned from directed evolution.
