The Definitive Reference for Food Scientists & Engineers

The **Second Edition** of the **Encyclopedia of Agricultural, Food, and Biological Engineering** focuses on the processes used to produce raw agricultural materials and convert the raw materials into consumer products for distribution. It provides an improved understanding of the processes used in the production and manufacture of consumer products of agricultural origin. With more than 400 entries, the encyclopedia examines the processes used to convert raw materials into safe, convenient, and nutritious foods as well as the many other consumer products manufactured from raw agricultural materials. In addition to completely new entries based on new developments in the field, this second edition provides updates to existing entries.

- Applies engineering concepts and principles to production agriculture, including the design of machinery and structures used and the management of water required for these operations
- Gives specific attention to crop production, including the harvesting, storage, and handling of major and minor crops
- Focuses on animal production, including all aspects requiring engineering inputs
- Covers food handling, storage, processing, packaging, and distribution, with specific emphasis on the design of facilities, equipment, and processes needed to deliver safe and high-quality food products to the consumer
- Addresses unique processes associated with the preservation of foods, using thermal processes, refrigeration, dehydration, and similar processes
- Explores the more basic engineering concepts associated with biological systems
- Presents the common fundamentals that have evolved with other biological systems, including those in the environment and in humans

The encyclopedia emphasizes the significant role of engineering in the development and design of the processes and equipment for the production and manufacturing of products of agricultural origin. The entries expand on the original concepts and introduce many new topics based on the evolution of developments in agricultural production, the conversion of raw materials into food products and the biological processes used throughout the system. The second edition continues to address critical components of a system with the capacity to deliver food and other consumer products to an expanding world population. This encyclopedia provides the knowledge necessary for readers to contribute to the safety and nutrition of the global food supply as well as the other products that contribute to a quality of life for consumers.

Editorial Review

The scope has expanded to include new processes developed at the micro- and nanoscales, applications of new sensory technologies, and sustainability issues related to food and agricultural security. Readers do not need extensive technical backgrounds in order to understand the articles, written by experts from around the world. Useful illustrations, graphs, and formulas continue to enhance the narrative entries. In addition to an excellent index and alphabetical table of contents, a topical table of contents groups articles across both volumes under agricultural, biological, and food engineering taxonomies. ... Summing Up: Recommended. Lower-level undergraduates and above; general readers.

?K.L. Carriveau Jr., Baylor University, in *CHOICE*, July 2011, Vol.48, No.11 The concept of a reference on this field of engineering is an important step in recognizing the importance of not only engineers but all scientists in the food and agricultural industries.

?John J. Classen, Professor of Biological and Agricultural Engineering, North Carolina State University, Raleigh, USA

... a valuable resource [for] any library in our field.

?Mark R. McLellan, Professor and Director, Institute of Food Science and Engineering, Texas A&M University, College Station, Texas, USA

... covers a wide ranging set of technical topics and contemporary perspectives.

?Bernard Y. Tao, Department of Agricultural and Biological Engineering, Purdue University, West Lafayette, Indiana, USA

... one of the best encyclopedias I have seen in the area of agricultural, food and biological engineering. Dr. Heldman is to be commended.

?Daryl Lund, Professor of Food Engineering, University of Wisconsin-Madison, USA

... an exhaustive, in-depth and professionally thorough resource.

?*MBR: Internet Bookwatch*

This is the first publication to bring together authoritative information in this discipline ... highly recommended.
